

InceptionV4, DTR: how 7.9 MB more budget leads to a failure

Intervention at 0.235, same budget: never evicting storage 3131 → completes (1.477×).
Control, same wrapper with no retained tensor → out of memory (peak pinned 2.63 GB; max nesting depth 193; depth at peak pinned 188).

Which tensor is needed later is hindsight from the trace; DTR's score ($e*/(\text{size} \cdot \text{staleness})$) does not use future accesses. simrd reference simulator; no allocator model.
