

## InceptionV4, DTR: how 7.9 MB more budget leads to a failure

Intervention at 0.235, same budget: never evicting storage 3131 → completes (1.477×).  
Control, same wrapper with no retained tensor → out of memory (2.63 GB pinned, depth 188).

Which tensor is needed later is hindsight from the trace; DTR's score ( $e*/(\text{size} \cdot \text{staleness})$ ) does not use future accesses. simrdr reference simulator; no allocator model.
